

Summary

Main Features

Data from the monthly Labour Force Survey are released in two stages. The Labour Force, Australia, Detailed - Electronic Delivery (cat. no. 6291.0.55.001) and Labour Force, Australia, Detailed, Quarterly (cat. no. 6291.0.55.003) are part of the second release, and include detailed data not contained in the Labour Force, Australia (cat. no. 6202.0) product set, which is released one week earlier.

The Labour Force, Australia, Detailed - Electronic Delivery (cat. no. 6291.0.55.001) is released monthly. Labour Force, Australia, Detailed, Quarterly (cat. no. 6291.0.55.003) includes data only collected in February, May, August and November (including industry and occupation).

Since these products are based on the same data as the Labour Force, Australia (cat. no. 6202.0) publication, the 6202.0 Labour Force, Australia Explanatory Notes are relevant to both releases.

What's New in the Labour Force

WHAT'S NEW IN THE LABOUR FORCE

REVISED POPULATION REBENCHMARKS

The latest available Estimated Resident Population data has been incorporated into revised population benchmarks which underpin the compilation of the Labour Force series. Labour Force series from January 2014 to October 2015 have been revised in original terms, with related revisions to seasonally adjusted and trend data. Revised series (including data up to the October 2015 reference month but prior to the inclusion of the November 2015 data), were released on 3 December 2015 in the October 2015 issue of Labour Force, Australia - Rebenchmarked Estimates (cat. no. 6202.0.55.003). The inclusion of the November 2015 data in this issue will result in further revisions to the seasonally adjusted and trend data as a result of the usual concurrent seasonal adjustment process.

NEW LABOUR FORCE OUTPUTS

New data measuring monthly underutilisation have been released with the November 2015 issue of Labour Force, Australia, in spreadsheet tables 24 and 25. This data is on the same conceptual basis as the existing quarterly measures of underutilisation. However, since the monthly data is only available from July 2014, seasonally adjusted and trend data on a monthly basis will not be available until mid 2017. A minimum of three years of data are generally required before seasonality can be reliably determined. At the same time in mid 2017, the scope of underemployment (which is one component of underutilisation) will be expanded to include those who are employed on a full-time basis and have sought and are available for additional hours.

To assist in the initial interpretation and use of the monthly underutilisation data, a brief article is available electronically with this release.

Further new outputs will be released with the November 2015 releases of Labour Force, Australia, Detailed - Electronic Delivery (cat. no. 6291.0.55.001) and Labour Force, Australia, Detailed, Quarterly (cat. no. 6291.0.55.003). These new outputs will be added to these releases on 23 December 2015, rather than with the main release on 17 December. New outputs attached to these products will include information relating to:

- monthly Full-time / part-time job search
- quarterly Volume measures of labour underutilisation
- quarterly Retrenchment
- quarterly Sector of main job (public / private).

A brief article will be released for each of the new items to assist in the initial interpretation and use of the data.

The new Status in Employment classification (which includes information on leave entitlements) was introduced in the July and August 2015 issues of Labour Force, Australia, Detailed - Electronic Delivery (cat. no. 6291.0.55.001) and Labour Force, Australia, Detailed, Quarterly (cat. no. 6291.0.55.003), respectively.

New outputs relating to educational attainment and educational attendance will not be included with the information published on December 23, as the data are undergoing further quality assurance, prior to their release. The ABS intends to release this data in the first half of 2016.

Update on Recommendation 7 from the Independent Technical Review

UPDATE ON RECOMMENDATION 7 FROM THE INDEPENDENT TECHNICAL REVIEW

INTRODUCTION

The Executive Summary of an independent technical review into the Labour Force Survey (LFS) and the ABS response to the review's recommendations were released on the ABS website on 9 December 2014. For details see the November 2014 issue of Labour Force, Australia (cat. no. 6202.0). Recommendation 7 of the review related to the use of Bayesian techniques in identifying and resolving problems with the LFS. An update on progress with this recommendation was provided in the May 2015 issue, and this note provides a further update.

Recommendation 7 of the review and the ABS response are:

Recommendation 7: Bayesian techniques should be considered as a means of identifying and resolving potential problems in core LFS series.

ABS Response: Agree and is in progress (in relation to assessing the relevance of the techniques) with findings to be reported by June 2015.

While the ABS is investigating Bayesian and related techniques, the ABS will continue to use the current composite estimator methodology for the Labour Force Survey and considerable additional work is required before these techniques can be considered a viable alternative.

MULTI-SOURCE METHODS

Following consultation with academics and stakeholders, the ABS has identified a number of indicator series and data sources that could potentially inform Labour Force estimates. This process considered a broad range of data sources that labour force analysts use to increase their understanding of the current labour market, including the data sources that have been assessed by the Department of Employment for their Leading Indicator of Employment.

These data sources are used by analysts in a variety of ways. In considering these different approaches, it is important to note that Bayesian techniques are one method of incorporating multiple sources of information, but there are also a range of other approaches. Recognising this, the ABS has now expanded its consideration of methods in which other information sources can be used, to more fully consider the possible multi-source methods.

Work is currently underway to further assess external sources of information and to determine how multi-source methods could be used to inform an estimate of current month labour force outcomes. For example, a Job Vacancies series provides some indication of labour market demand, but does not enable the direct estimation of the number of people employed or unemployed. Mathematical modelling can determine the relationship between the information source and the labour force outcomes, and the model can then be used to assess labour force outcomes from the information source.

No changes will be made to the estimation methodology for labour force statistics without extensive consultation, and if any change is proposed it will be communicated and explained well in advance of implementation.

The next update on this research is expected to be provided in the May 2016 issue.

Measures of underemployment and underutilisation

MEASURES OF UNDEREMPLOYMENT AND UNDERUTILISATION

INTRODUCTION

Underemployment describes a situation where the potential labour of employed people is not fully utilised. Along with unemployment, it is an important indicator of unused capacity given current labour market conditions.

Underutilisation encapsulates both unemployment and underemployment and provides more comprehensive information on the state of labour market and measures the extent to which all available labour force resources are not being fully used in the economy.

Given the importance of these measures, their frequency has been increased from quarterly to monthly from July 2014, as one of the Outcomes of the Labour Household Surveys Content Review (cat. no. 6107.0). From the November 2015 issue, original monthly underemployment and underutilisation information, covering July 2014 onwards, will be released in Labour Force, Australia (cat. no. 6202.0). This is in addition to the quarterly series, which will continue.

For most analytical purposes, trend or seasonally adjusted data are preferred. Given that at least three years of original monthly data are required before seasonality can be reliably determined, monthly seasonally adjusted and trend series will not be produced before July 2017. In the meantime, the ABS will continue to provide original, seasonally adjusted, and trend underemployment and underutilisation data on a quarterly basis, and monthly data on an original basis.

NEW MONTHLY UNDEREMPLOYMENT AND UNDERUTILISATION SERIES

Time series of the quarterly data, along with the new monthly data now available, are shown below.

SCOPE OF UNDEREMPLOYMENT AND UNDERUTILISATION

In addition to changing the frequency of underemployment and underutilisation measures (from July 2014), the ABS will also be expanding the scope of the series (from July 2017).

Currently, the scope of underemployed people includes:

- people employed part time who wanted to work more hours and were available to start work with more hours, either in the reference week or in the four weeks subsequent to the survey; or
- people employed full time who worked part time hours in the reference week for economic reasons (endnote 1).

When monthly seasonally adjusted and trend underemployment and underutilisation series become available, the scope of the underemployment measure will be increased to include all employed people who are underemployed. The increased scope will cover the additional group of people employed full-time, who worked full-time hours in the reference week (35 hours or more), and who would have preferred and were available for additional hours of work. Further details will be provided prior to this change.

ENDNOTES

1. It is assumed that these people wanted to work full time in the reference week and would have been available to do so.

Measures of full-time, part-time job search

FULL-TIME AND PART-TIME JOB SEARCH

As of July 2014, the Labour Force Survey (LFS) collects data that identify whether unemployed people are looking for full-time work, part-time work, or both. Prior to this, the sequencing in the LFS questionnaire resulted in people only being asked if they were looking for part-time work if they indicated that they had not been looking for full-time work. As a result, people who would have looked for both full-time work and part-time work were not identified. From July 2014, all unemployed people are asked whether they are looking for either full-time work, part-time work, or both.

Obtaining this detailed breakdown of unemployed people is a result of the review of Labour Force statistics, as

detailed in Outcomes of the Labour Household Surveys Content Review (cat. no. 6107.0).

Previously available information established that most unemployed people have been looking for full-time work. However, the new data show that most of these unemployed people have also been looking for part-time work as part of their job search. For example, 415,800 unemployed people were looking for both full-time and part-time work (60% of unemployed people) in July 2015. In addition, it can be seen that more unemployed people were only looking for part-time work than only for full-time work. This provides important insights into job search preferences and experiences of unemployed people.

These more detailed data are available from the November 2015 issue of Labour Force, Australia, Detailed, Quarterly publication (cat. no. 6291.0.55.003) in tables 20a, 20b and 20c.

Article Archive

This section provides an archive of articles and analysis published in Labour Force, Australia (cat. no. 6202.0), promoting the effective use of labour force statistics. Articles are sorted by publication date.

Articles on labour related topics are also available in Australian Labour Market Statistics (cat. no. 6105.0) and Australian Social Trends (cat. no. 4102.0).

History of Changes

This document was added or updated on 23/12/2015.

23/12/2015

Additional Labour Force, Australia, Detailed - Electronic Delivery (cat. no. 6291.0.55.001) November 2015 release of new monthly Labour Force outputs including:

- information relating to Unemployed persons who looked for full-time and part-time work, and
- employed persons by Hours usually worked in main job.

Explanatory Notes

Explanatory Notes

Data from the monthly Labour Force Survey are released in two stages. The Labour Force, Australia, Detailed - Electronic Delivery (cat. no. 6291.0.55.001) and Labour Force, Australia, Detailed, Quarterly (cat. no. 6291.0.55.003) are part of the second release, and include detailed data not contained in the Labour Force, Australia (cat. no. 6202.0) product set, which is released one week earlier.

The Labour Force, Australia, Detailed - Electronic Delivery (cat. no. 6291.0.55.001) is released monthly. Labour Force, Australia, Detailed, Quarterly (cat. no. 6291.0.55.003) includes data only collected in February, May, August and November (including industry and occupation).

Since these products are based on the same data as the Labour Force, Australia (cat. no. 6202.0) publication, the 6202.0 Labour Force, Australia Explanatory Notes are relevant to both releases.

Quality Declaration - Summary

QUALITY DECLARATION - SUMMARY

INSTITUTIONAL ENVIRONMENT

Labour Force statistics are compiled from the Labour Force Survey which is conducted each month throughout Australia as part of the Australian Bureau of Statistics (ABS) household survey program. For information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment.

RELEVANCE

The Labour Force Survey provides monthly information about the labour market activity of Australia's resident civilian population aged 15 years and over. The Labour Force Survey is designed to primarily provide estimates of employment and unemployment for the whole of Australia and, secondarily, for each state and territory.

TIMELINESS

The Labour Force Survey enumeration begins on the Sunday between the 5th and 11th of the month, except for the Christmas and New Year holiday period. In December enumerations starts between the 3rd and 9th (4 weeks after November enumeration begins). In January enumeration starts between the 7th and 13th (5 weeks after December enumeration begins).

Key estimates from the Labour Force Survey are published in two stages. The first, Labour Force, Australia (cat. no. 6202.0), is released 32 days after the commencement of enumeration for the month, with the exception of estimates for December which are published 39 days after the commencement of enumeration.

The second stage includes detailed data that were not part of the first stage and are published in Labour Force, Australia, Detailed - Electronic Delivery (cat. no. 6291.0.55.001) and Labour Force, Australia, Detailed, Quarterly (cat. no. 6291.0.55.003). The second stage is released 7 days after the first stage.

ACCURACY

The Labour Force Survey is based on a sample of private dwellings (approximately 26,000 houses, flats etc) and non-private dwellings, such as hotels and motels. The sample covers about 0.32% of the Australian civilian population aged 15 years or over. The Labour Force Survey is designed primarily to provide estimates of key labour force statistics for the whole of Australia and, secondarily, for each state and territory.

Two types of error are possible in an estimate based on a sample survey: non-sampling error and sampling error.

Non-sampling error arises from inaccuracies in collecting, recording and processing the data. Every effort is made to minimise reporting error by the careful design of questionnaires, intensive training and supervision of interviewers, and efficient data processing procedures. Non-sampling error also arises because information cannot be obtained from all persons selected in the survey. The Labour Force Survey receives a high level of cooperation, with an average response rate for the last year being 94%.

Sampling error occurs because a sample, rather than the entire population, is surveyed. One measure of the likely difference resulting from not including all dwellings in the survey is given by the standard error. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included in the survey, and about nineteen chances in twenty that the difference will be less than two standard errors.

Standard errors of key estimates and movements since the previous month are available in Labour Force, Australia (cat. no. 6202.0). The standard error of other estimates and movements may be calculated by using the spreadsheet contained in Labour Force Survey Standard Errors, Data Cube (cat. no. 6298.0.55.001).

COHERENCE

The ABS has been conducting the Labour Force Survey each month since February 1978. While seeking to provide a high degree of consistency and comparability over time by minimising changes to the survey, sound survey practice requires careful and continuing maintenance and development to maintain the integrity of the data and the efficiency of the collection.

The changes which have been made to the Labour Force Survey have included changes in sampling methods, estimation methods, concepts, data item definitions, classifications, and time series analysis techniques. In introducing these changes the ABS has generally revised previous estimates to ensure consistency and coherence with current estimates. For a full list of changes made to the Labour Force Survey see Chapter 20 in Labour Statistics: Concepts, Sources and Methods (cat. no. 6102.0.55.001).

INTERPRETABILITY

The key estimates from the Labour Force Survey are available as original, seasonally adjusted and trend series. Seasonal adjustment is a means of removing the effects of normal seasonal variation from the series so other influences on the series can be more clearly recognised. Seasonal adjustment does not aim to remove the irregular influences which may be present and therefore month-to-month movements may not be reliable indicators of underlying behaviour. To assist in interpreting the underlying behaviour, the ABS produces the trend series by smoothing the seasonally adjusted series to reduce the impact of the irregular component. For further information, see A Guide to Interpreting Time Series - Monitoring Trends (cat. no. 1349.0).

Further information on the terminology and other technical aspects associated with statistics from the Labour Force Survey can be found in the publication Labour Force, Australia (cat. no. 6202.0), which contains detailed Explanatory Notes, Standard Error information and a Glossary.

ACCESSIBILITY

Please see the Related Information tab for the list of products that are available from this collection.

Time Series Spreadsheet (I-Note) - Time Series Spreadsheet

Due to the flooding in Queensland in January 2011, the relative standard errors for January 2011 will vary across regions and will be higher than normal in some regions. The RSEs for the Darling Downs-South West and Ipswich City Statistical Regions are expected to be approximately 50% higher, while the RSEs for the Brisbane City Inner Ring Statistical Region will increase by approximately 25%. The Brisbane City Outer Ring, West Moreton and Mackay-Fitzroy-Central West Statistical Regions will have RSEs approximately 10% higher. All other regions have minimal differences. However from February 2011, the data returns to normal. Refer to the article Impact of the floods on the Labour Force Survey in January 2011 for more information.

The new labour force sample was phased-in over four months from May to August 2013. See the article on page 10 of the May 2013 issue of Labour Force, Australia (cat. no. 6202.0) for more information. During phase in of the new sample, standard errors associated with key labour force data were expected to increase by approximately 10% at a national level, however increased standard errors and variability in the estimates may be more evident in detailed regional data during this time.

Data Cubes (I-Note) - Data Cubes

Due to the flooding in Queensland in January 2011, the relative standard errors for January 2011 will vary across regions and will be higher than normal in some regions. The RSEs for the Darling Downs-South West and Ipswich City Statistical Regions are expected to be approximately 50% higher, while the RSEs for the Brisbane City Inner Ring Statistical Region will increase by approximately 25%. The Brisbane City Outer Ring, West Moreton and Mackay-Fitzroy-Central West Statistical Regions will have RSEs approximately 10% higher. All other regions have minimal differences. However from February 2011, the data returns to normal. Refer to the article Impact of the floods on the Labour Force Survey in January 2011 for more information.

The new labour force sample was phased-in over four months from May to August 2013. See the article on page 10

of the May 2013 issue of Labour Force, Australia (cat. no. 6202.0) for more information. During phase in of the new sample, standard errors associated with key labour force data were expected to increase by approximately 10% at a national level, however increased standard errors and variability in the estimates may be more evident in detailed regional data during this time.

Data Cubes (I-Note) - Data Cubes

Due to the flooding in Queensland in January 2011, the relative standard errors for January 2011 will vary across regions and will be higher than normal in some regions. The RSEs for the Darling Downs-South West and Ipswich City Statistical Regions are expected to be approximately 50% higher, while the RSEs for the Brisbane City Inner Ring Statistical Region will increase by approximately 25%. The Brisbane City Outer Ring, West Moreton and Mackay-Fitzroy-Central West Statistical Regions will have RSEs approximately 10% higher. All other regions have minimal differences. However from February 2011, the data returns to normal. Refer to the article Impact of the floods on the Labour Force Survey in January 2011 for more information.

The new labour force sample was phased-in over four months from May to August 2013. See the article on page 10 of the May 2013 issue of Labour Force, Australia (cat. no. 6202.0) for more information. During phase in of the new sample, standard errors associated with key labour force data were expected to increase by approximately 10% at a national level, however increased standard errors and variability in the estimates may be more evident in detailed regional data during this time.

Standard Errors

Estimates from the Labour Force Survey (LFS) are based on information collected from people in a sample of dwellings, rather than the entire population. Hence the estimates produced may differ from those that would have been produced if the entire population had been included in the survey. The most common measure of the likely difference (or 'sampling error') is the **standard error** (SE).

The ABS considers that estimates with a relative standard error of 25% or more may be subject to sampling variability too high for most practical purposes.

To determine if an item has a relative standard error of 25% or more, in SuperTABLE, right click in the centre of the table, select annotate cells - standard annotations, and select 'Annotate RSE cut-off values'.

To indicate those cells in spreadsheets with a relative standard error of 25% or more, annotations have been applied prior to dissemination.

In addition, the tables below have been supplied to show estimates at which the relative standard error is 25%. Estimates of the size indicated in the tables, or smaller, are considered to be subject to sampling variability too high for most practical purposes.

Due to the January 2011 flooding in Queensland the relative standard errors for January 2011 will be higher than normal in some regions, therefore for Queensland the estimates at which the relative standard error is 25% will be higher than they appear in the tables below. However from February, the data returns to normal.

The new labour force sample was phased-in over four months from May to August 2013. During phase in of the new sample, standard errors associated with key labour force data were expected to increase by approximately 10% at a national level, however increased standard errors and variability in the estimates may be more evident in detailed regional data during this time.

The RSEs for July 2013 (50% old sample, 50% new sample) and onwards will be subject to revisions in the future, as more information is known about the new sample after it has been introduced.

Additional information on how standard errors for LFS estimates are produced is available in Labour Force Survey Standard Errors, Data Cube (cat. no. 6298.0.55.001).
